More and more design engineers want to perform full-wave EM analysis of their high frequency products to fully validate performance and catch potential problems before the first hardware prototype, but today are held back by the lack of 3D component models.

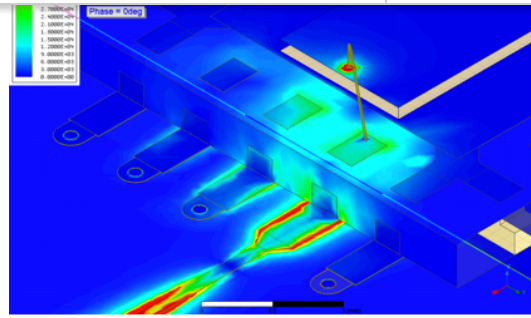

*We are on a mission to change that!*

ANSYS HFSS 3D Components enable electric component suppliers and system integrators to share HFSS 3D models without compromising solution accuracy or design IP. Early adopters of this new collaborative paradigm are reporting significant benefits including:

- Improved sales
- Closer engagements with customers
- Reduced engineering time

Join us in this exclusive session to learn how your company can get involved with this important way to win new business by becoming part of this paradigm shifting way to enable customer design success.
